i.Exercise2.4.8

Kaarthik Sundaramoorthy, Sahil Shah and Vidhi Shah

5/24/2020

This exercise relates to the **College** data set, which can be found in the file **College.csv**. It contains a number of variables for 777 different universities and colleges in the US.

(a) Use the read.csv() function to read the data into R. Call the loaded data college. Make sure that you have the directory set to the correct location for the data.

```
getwd()
```

[1] "C:/Users/Sahil Shah/Documents/GitHub/Data-Driven-Knowledge-Discovery/KDD"

```
college <- read.csv("College.csv")</pre>
```

(b) Look at the data using the fix() function. You should notice that the first column is just the name of each university. We don't really want R to treat this as data. However, it may be handy to have these names for later. Try the following commands:

```
#fix(college)
rownames ( college )= college [,1]
college = college [,-1]
##fix ( college )
```

```
library(knitr)
library(kableExtra)
kable(head(college), format = "latex", booktabs=T) %>%
   kable_styling(latex_options="scale_down")
```

	Private	Apps	Accept	Enroll	Top10perc	Top25perc	F.Undergrad	P.Undergrad	Outstate	Room.Board	Books	Personal	PhD	Terminal	S.F.Ratio	perc.alumni	Expend	Grad.Rate
Abilene Christian University	Yes	1660	1232	721	23	52	2885	537	7440	3300	450	2200	70	78	18.1	12	7041	60

```

(c) ii. Use the pairs() function to produce a scatterplot matrix of the first ten columns or variables of the data. Recall that you can reference the first ten columns of a matrix A using A[,1:10].

```
pairs(college[,1:10])
```

(c) iii. Use the plot() function to produce side-by-side boxplots of Outstate versus Private

```
attach(college)
plot(Outstate~Private, data=college, xlab = "Private", ylab = "Outstate")
```

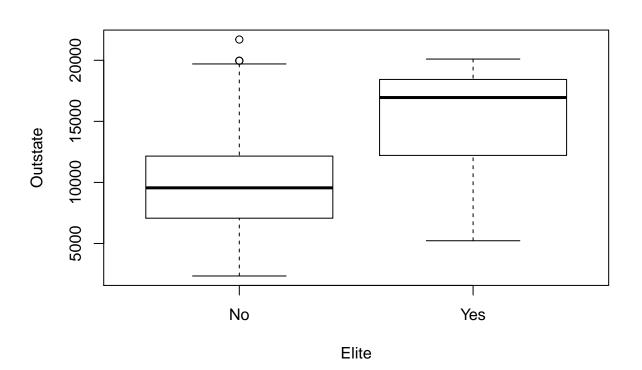

(c) iv. Create a new qualitative variable, called Elite, by binning the Top10perc variable. We are going to divide universities into two groups based on whether or not the proportion of students coming from the top 10 % of their high school classes exceeds 50 %.

```
Elite = rep("No", nrow(college))
Elite[Top10perc>50] = "Yes"
#Elite
Elite = as.factor(Elite)
college = data.frame(college, Elite)
summary(college)
```

```

```

plot(Outstate~Elite, xlab = "Elite", ylab = "Outstate")

(c) v. Use the hist() function to produce some histograms with differing numbers of bins for a few of the quantitative variables. You may find the command par(mfrow=c(2,2)) useful: it will divide

the print window into four regions so that four plots can be made simultaneously. Modifying the arguments to this function will divide the screen in other ways.

```
par(mfrow=c(2,2))
hist(Apps, breaks=50, xlim=c(0,25000), main="Apps")
hist(Enroll, breaks = 25, main = "Enroll")
hist(Expend, breaks = 25, main = "Expend")
hist(Outstate, breaks = 25, main = "Outstate")
```

(c) vi. Continue exploring the data, and provide a brief summary of what you discover.

```
table(Private, Elite)

## Elite
## Private No Yes
## No 199 13
## Yes 500 65

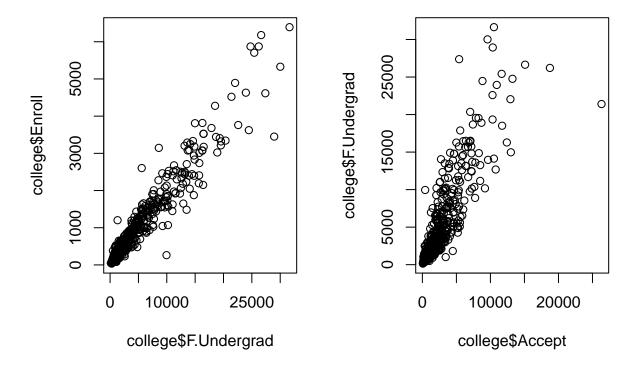

library(gmodels)
CrossTable(Private, Elite)
```

##
```

The following table describes the matrix in which it holds the colleges which are in the Elite or the Private variable. The table shows the information about how many colleges are in the Elite section with yes or no and how many are in Private.

```
par(mfrow = c(1,2))
plot(college$F.Undergrad, college$Enroll)
plot(college$Accept, college$F.Undergrad)
```

According to the scatter plot from the **College** dataset it is really hard to find the correlation between the variables. Although we can find the strong relation between the F.undergrad and Enrollment in the colleges section. Also there is strong relation in the acceptance of the students which are undergraduates.
